Dear Mr. Lamb,

Watching the Governors Conference on C. Span today, I was fascinated by the talk about the future of super trains. Earlier in the day I had listened to workers mourning the forthcoming demise of Electric Boat submarine works at Groton, Connecticut, and the great loss of jobs, and I found myself wondering if someone with imagination and drive could find a way to convert an Electric Boat to Super Train and revive the locomotive industry in the U.S.A. If we could start up a U.S. fast train it would produce an enormous number of jobs, not only in the locomotive factory, but in electronics for signals, track laying and hardware, building and re-laying lines etc. Could C. Span feature some talks and discussions to explore the possibilities. How about diverting some defence cut funds to finance such a programme?

The author of the book 'Super Trains'

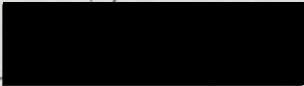

was interesting and articulate, and I would like to hear him on a listener phone exchange.

C-Span is a wonderful concept, and is truly educating and involving the public in a completely unbiased presentation. Perhaps we could expand its focus to include more scientists, engineers and technicians and a few less journalists who generally seem to be repeating their own rhetoric.

The U.S. seems to need a spark, something like the space programme, to galvanize the wonderful energy and imagination of its people. Wouldn't it be great if C-Span could provide the catalyst?

Thank you Mr. Lamb, and keep up the excellent work.

Yours sincerely,

(Mrs).
